

2 litres for 50 ft of film or double the whole recipe for 100 ft. We mostly developed in buckets. The more film developed at once the more scratches.

The basic principle is to gather four fist fulls of plant materials. Grind and mash with a mortar and pestle. Cover with 2 litres of boiling water and let cool to room temperature. Once cooled add in this order:  
180 grams of washing soda (sodium carbonate)  
40 grams of Vitamin C in powder form (ascorbic acid in powder form)

\*\*\* Always add the vitamin c last. The more powerful the mixture the more fizz when the vitamin c goes in.
